

You can delve deeper into the world of fascinating facts and intriguing information about the creatures of the shore and all the work we do at www.mcsuk.org

Do you know your barnacles from your limpets or your hornwrack from your bladderwrack?
Can you spot a sanderling, starfish or sea potato without a second glance?
Well, if you like scouring the shoreline for bits of driftwood and shells or have ever wondered at the natural treasures the tide brings in but aren't sure what everything is, then the MCS Seashore Safari Guide will reveal some of the secrets of the strandline.

The strandline - the top bit of the beach where man-made and natural objects washed up on the waves are left as the tide recedes - is a place of wonder and fascination.
Take the MCS Seashore Safari Guide with you every time you head to the beach and see how many seashore treasures you can find.

I see seashells on the seashore

Seashore Safari Guide

Explore the seashore with the Marine Conservation Society

Protecting our seas, shores and wildlife

Our seas and shores are home to amazing wildlife, vital fish stocks, and give enjoyment for everyone. But too many fish are being taken out, too much rubbish is going in and too little has been done to protect our the seas around the UK.
MCS works tirelessly for healthier seas and abundant wildlife - and you can help us achieve our vision of seas fit for life.

Beachwatch

Regular beach cleans that help us identify where rubbish comes from and how to stop it.

Sea Champions

A network of active volunteers who champion the seas on behalf of MCS.

Marine life sighting schemes

If you are lucky enough to see basking sharks, turtles or jellyfish, use our online wildlife sighting surveys to report them to MCS. If you dive, you can take part in underwater Seasearch surveys.

Good Fish Guide

Contact us for a pocket Good Fish Guide, or download our smartphone app to help you choose sustainable seafood - visit www.goodfishguide.org

Join us

As a charity we rely on donations and subscriptions to carry out our vital work. By becoming a member you will be supporting the UK's leading marine conservation charity - visit www.mcsuk.org/join to find out how.

Stretching around 16,000km, the coastline around the British Isles is a huge playground for everyone to enjoy.

Follow the MCS Seashore Code and enjoy the coast, without harm to yourself or wildlife.

Seashore Code

Explore responsibly

- ★ Leave animals where you find them.
- ★ Carefully lift and replace any rocks you move and leave attached seaweed in place.
- ★ Seashells nurture an interest in nature amongst children, so if you want to take a couple home only take empty open shells (like limpets and mussels) and leave the shells that can provide a home for hermit crabs (like whelks and periwinkles).

Keep it tidy

- ★ Take your rubbish home - don't bury it or burn it.
- ★ Poop scoop your dog's waste then bin it responsibly.

Watch with care

- ★ Watch quietly from a distance, especially near birds and seals with pups.
- ★ Control your dog and keep it on a lead near birds and seals.

Mind your step

- ★ Keep to established paths and dune boardwalks.
- ★ If you dig holes in the beach, please fill them up again.
- ★ Don't climb up or go near the top or bottom of a cliff.
- ★ Check tide times to avoid being cut off.
- ★ Keep away from soft sand and mud, and beware of slippery rocks.

Seashore Safari Guide

Explore the seashore with the Marine Conservation Society

BARNACLES
These animals live upside down, permanently stuck to the rock with their legs sticking upwards ready to catch drifting food.

COMMON LIMPET
A snail with a homing instinct! It grazes on algae while the tide is in and returns to the same spot, called a home scar, when the tide retreats.

SLIPPER LIMPET
Accidentally introduced to England from North America and now found in huge numbers. It has no predators in Europe.

COCKLE
Cockles spot predators using their many antennae and eyes. By extending their 'leg' outside the shell, they can jump around 10cm.

RAZORSHELL
Shaped like an old-fashioned cut throat razor, these animals live buried end-up in the sand.

DOG WHELK
Meat-eating sea snails that drill holes into limpets, turn their insides into soup and suck up the yummy contents!

COMMON WHELK
A large edible sea snail, twice the size of the dog whelk, the empty shell makes a good home for hermit crabs so please leave these shells on the shore.

PAINTED TOP SHELL
A tall shell with stripes of purple and white in a striking conical shape. The body of this "snail" is also colourfully flecked with purple, red and brown.

PURPLE /FLAT TOP SHELL
This shell is a flattish cone shape with stripes of reddish purple.

COMMON WHELK EGG CASES
Puffy balls of white eggcases laid by the common whelk. Used to be used by sailors as wash balls!

CUTTLEBONE
Cuttlefish aren't fish at all, but are molluscs related to squid and octopus. This structure once gave the shape to the cuttlefish body.

SEA POTATO
A heart shaped sea urchin adapted for burrowing. It lives just below the surface on clean sand.

PINK SEA FAN SKELETON
Although they look like plants, pink sea fans are actually colonies of coral that are made up of animals whose hard skeletons run through the fan.

MERMAID'S PURSE
Egg cases of dogfish, skates and rays, which attach to seaweed with entwining tendrils and often wash up once the animals have hatched.

COMMON STARFISH
The familiar five arms and usual orange colour are unmistakable. They move with their tube feet and eat with their stomachs inside out!

BRITTLESTAR
These guys have a small central disk and long slender arms which they can self-amputate if being attacked and then regrow once the wound heals.

BEADLET ANEMONE
Has a band of "beads" around the top of its body, hence the name. When the tide goes out they retract their tentacles so they won't dry out.

SNAKELOCKS ANEMONE
These anemones can have up to 200 tentacles! Their tentacles remain out all of the time, they don't retract them like other anemones.

BLADDERWRACK
The small air-filled bladders along the fronds help this seaweed to float towards the surface of the water to photosynthesise.

KELP HOLDFAST
Curious oddments that can look like skeleton sections, but each is simply the holdfast, or 'roots' of large seaweeds known as kelp.

HORNWRACK
Remains of a colony of hundreds of tiny animals called bryozoans, or 'moss animals'. It has a distinctive lemon-like smell when fresh.

DUNLIN
The dunlin is the most widespread and common wader in Europe. It has a slightly down-curved bill and a black belly patch in breeding plumage.

SANDERLING
These birds can be spotted running up and down the shore as each wave comes in. A winter visitor to the UK.

HERRING GULL
These cheeky fellows with the red spot on their beaks are found along most coasts and are easily attracted by a bag of chips!

OYSTERCATCHER
Striking black and white plumage with long bright orange-red bills, oystercatchers eat a third of their body weight every day.

MOON JELLYFISH
Mostly harmless, though may sting sensitive skin. Jellyfish are the favourite food of the leatherback turtle.

VELVET SWIMMING CRAB
Its upper shell has a feeling of soft velvet and its blood red eyes and aggressive demeanor have given it the common name "Devil Crab".

EDIBLE CRAB
This pinkish brown crab has chunky claws and its shell looks like a pastry crust.

COMMON SHORE CRAB
A common rock pool or shallow water species. Males have a triangular shape on their stomachs - females a semi-circular shape.

SANDHOPPER
This shrimplike creature lives amongst seaweeds on the beach, they are found hopping around when the tide is out.

COMMON BLENNY
These fish can change colour to blend in with their surroundings. They have sharp teeth for crunching barnacles off rocks.

ROCK GOBY
Gobies are often confused with blennies but they have two distinctly separate fins on their backs whereas blennies only have one back (dorsal) fin.
